CONTACT US

We look forward to assisting you in selecting the best stock or custom engineering grade adhesive for your application!

Our team is dedicated to providing high quality products that meet today's challenges for improvements in performance, efficiency, and cost effectiveness.

Permabond manufactures engineering adhesives and sealants for industrial use. We have a large number of specialty products and work with design engineers to custom formulate to engineering specifications. A sampling of products is listed on the following pages. Please note strength results will vary depending on the level of surface preparation and gap.

ISO 9001:2015 Certified

Permabond products conform to many company and industry specifications. Some of the most common are listed here.

DESIGN CONSIDERATIONS

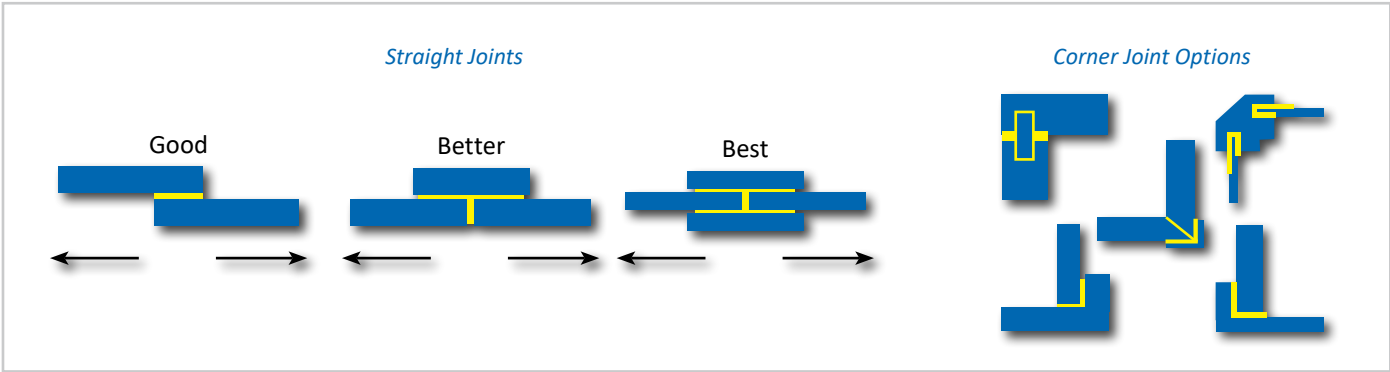

Designing components and assembly processes with adhesive use in mind improves quality and efficiency. In addition to adhesion, consider joint design, surface preparation, gap fill and viscosity, adhesive usage, and service conditions.

Joint Designs

Typical Joints

Suggested Improvements

Substance	Viscosity mPa.s = cP	Substance	Viscosity mPa.s = cP
Water	1	Maple syrup	5,000
Milk	3	Honey	10,000
SAE 10 Motor oil	85-140	Chocolate syrup	25,000
SAE 20 Motor oil	140-420	Ketchup	50,000
SAE 30 Motor oil	420-650	Mustard	70,000
SAE 40 Motor oil	650-900	Sour cream	100,000
Castor oil	1,000	Peanut butter	250,000

Gap Fill and Adhesive Viscosity

Adhesive viscosity and gap fill capability are closely related - generally, for a given chemistry, the higher the adhesive viscosity, the larger the gap filling capability. It is important to note the maximum gap fill for each product. Exceeding the maximum gap fill can weaken bond strength. To help “get a feel” for viscosity measurements, the list to the left shows everyday substances and their approximate viscosity.

Surface Preparation

Most materials can be bonded without surface pre-treatment unless surfaces are grossly contaminated. To achieve maximum performance and repeatable results, it is advisable to ensure the bond-able surface is clean and consistent. Increasing the surface energy can optimize the bond strength. Various surface treatments can be used to increase the surface energy.

Permabond 2K Primer

Permabond 2K Primer improves adhesion, prevents corrosion, and provides easy visual inspection of surface bondability.

On the left, the 2K Primer wets out the surface leaving a uniform coating. The surface to the right is not yet prepared well for bonding and the 2K primer beads up. Showing further surface treatment is needed.

Salt Spray - Durability on Aluminum

The graph to the right shows the strength retention with and without Permabond 2K Primer on abraded aluminum surfaces bonded with structural acrylic adhesive. The results of the salt spray aging test show improved durability.

ADHESIVE SELECTION

Selecting the most appropriate adhesive for an engineering application requires consideration of a number of factors. The following tables and charts will aid to narrow down the options. Permabond welcomes the opportunity to assist in your selection.

ASC 10 Anaerobic Surface Conditioner

Permabond ASC10 is a surface activator for anaerobic adhesives, suitable for use on non-metallic surfaces or on less active metals (see chart on page 10) to accelerate cure speed and allow products to cure through larger gaps.

Permabond threadlocking anaerobic adhesives and sealants enable you to lock screws, nuts, bolts, and studs against loosening.

- Lubricate for easier assembly and prevents rust
- Seal against leaks
- Prevent loosening due to thermal expansion
- Stop nuts and bolts from working loose due to vibration
- Varying strengths to meet removable and permanent requirements
- More cost-effective than mechanical locking devices

Metal Reactivity as Related to Anaerobic Cure Speed

Reactivity	Super Active	Active	Less Active	Passive
Anaerobic Cure Speed	Very Fast Cure	Fast Cure	Slow Cure	Activator Needed
Metal	Brass Copper	Steel Nickel Iron Aluminum Zinc	Anodized aluminum Cadmium finishes Chrome finishes Passivated metals Stainless steel Titanium	Ceramics Glass Plastics Painted finishes Lacquered finishes

Threadlocking

ANAEROBIC THREAD SEALANTS

Permabond anaerobic thread sealants are designed to replace traditional materials such as hemp, PTFE tape, and pipe dope.

- No loose particles to clog valves
- Will not shred, creep, or relax over time
- Lubricates for easier assembly, allows accurate positioning of pipes
- Fully cured sealants typically seal to the burst pressure of the pipe
- Grades available for water, gas, air, and hydraulic systems
- Resistant to a wide variety of chemicals

ASC 10 Anaerobic Surface Conditioner						
Permabond ASC10 is a surface activator for anaerobic adhesives, suitable for use on non-metallic surfaces or on less active metals to accelerate cure speed and allow products to cure through larger gaps.						

*BAM Approved for use with gaseous oxygen up to 10 bar (145 psi) and 60°C (140°F).

Chemical Compatibility of Anaerobic Adhesives & Sealants

Few industrial chemicals have a damaging effect on Permabond's anaerobic adhesives. However, strong concentrations or elevated temperature may make the adhesive more susceptible to chemical degradation.

Liquids									Gases		
Acetic acid	B	Chromic acid	C	Glycerine	A	Oil (hydraulic)	A	Shellac	A	Air	A

A: Most Permabond products are suitable

B: For concentrations up to 10% most adhesives can be used

C: Only use high-strength Permabond products

X: Not suitable for Permabond anaerobic adhesives

**Test first as some brands/types are more aggressive than others*

**** MH052 - Approved for use with gaseous oxygen up to 10 bar (145 psi) and 60°C (140°F).**

Thread Sealing Assembly and Removal Technique

■ Parallel to parallel pipe joints

(Fig A.) Apply sealant to the leading edge of the male component.

■ Tapered to parallel pipe joints

(Fig B.) Apply sealant several threads back from the leading edge of the male component to ensure maximum contact.

* IN EACH CASE EXCESS SEALANT SHOULD BE VISIBLE AFTER TIGHTENING

The purpose of the excess is to visualize complete 360° coverage to ensure no leaks. The exposed sealant will not cure as it is in contact with air. This excess can be wiped away.

Pipe joints sealed with low-strength thread sealants can be dismantled using normal tools. Heating parts with a hot air gun or blow torch will make parts easier to disassemble. Before reapplying sealant, clean pipe joints with a wire brush.

ANAEROBIC RETAINING COMPOUNDS

Permabond retaining compounds are for the permanent bonding of co-axial joints. They provide 100% surface-to-surface contact while mechanical joining techniques provide only 20% of surface-to-surface contact. The resulting surface area increase allows for a greater load carrying capacity, more than 5 times that of mechanical joining techniques.

- Augment slip fits
- Prevent corrosion
- Mount bearings
- Restore correct fit
- Reduce machining time due to relaxed tolerances
- Quick and easy assembly of parts
- 100% surface-to-surface contact
- Allow for greater load carrying capacity

Retaining Compounds vs. Press Fits

Press Fit (6 micro-inch finish)

Adhesive (6 micro-inch finish)

Adhesive (machine finish)

Adhesive Bonded

100% contact area is used to transfer load

Press Fit

25% to 30% of metal to metal contact

Note: The highest strength is achieved with the least expensive tolerance and finish.

ANAEROBIC F.I.P. GASKETING

Permabond gasketing anaerobic adhesives replace traditional cork, wood, rubber, paper, and silicone gaskets.

- No relaxation or shrinkage eliminates need to re-tighten over time
- One adhesive will replace many pre-cut gasket shapes
- No need to handle fragile gaskets
- No disintegration means no leaks or blockages
- Vibration proof
- No long-term embrittlement
- Easy to dismantle with normal tools
- 100% surface contact for uniform stress distribution
- Seals rough surfaces; reduces machining needs
- Non-shimming

Anaerobic Form-in-Place Gasketing

Grade	HH190	MH196	LH197	MH199
Features	General purpose flange sealant	Fast curing, high temperature resistant	Flexible, easy to remove even from soft metals	Highly thixotropic, high temperature resistant

Oil Resistance	Excellent	Excellent	Excellent	Excellent
Water Resistance	Excellent	Excellent	Excellent	Excellent

Form-in-Place Gaskets

Liquid gasketing adhesives give 100% contact between metal parts and also allow the engineer to cut down the amount of surface-finish machining, therefore reducing costs and increasing production rates.

CYANOACRYLATES

Permabond® Cyanoacrylate (instant) Adhesives are single component adhesives that cure by reacting to small traces of moisture on the surface of the substrates being bonded. They develop strength very quickly at room temperature, eliminating the need for costly ovens or curing equipment. Full strength is achieved in 24 hours.

For best results, use only enough adhesive to cover the bond area. Excess adhesive will not increase bond strength and can reduce cure speed.

Mil Specs and other approvals are listed on pages 3 and 4.

The original cyanoacrylate, 910, set the highest standard against which all our formulations are measured. 910 is still the only pure methyl and creates the strongest bonds. Permabond continues the tradition of excellence by formulating products that meet many diverse application needs for very strong bonds, high temperature resistance, and purity. “The Original 910” formula remains unchanged. The reason is simple - it is the best metal bonding formulation there is.

Instant Bonds! Apply the adhesive, assemble the components, and count... one, two, three, four, five, six, seven, eight, 9, 10! That’s It! Parts are bonded.

Primers, Accelerators and Solvents

Grade	Description
POP	POP (Polyolefin Primer) improves the adhesion of cyanoacrylate adhesives to PP, PE, PTFE, other low surface energy plastics, and silicones.
QFS10 QFS16 CSA-NF	QFS10, QFS16, and CSA NF increase the speed of cure of cyanoacrylates and cure any exposed cyanoacrylate adhesive very quickly, reducing blooming and allowing products to cure through larger gaps.
CA Solvent 100	Permabond CA solvent dissolves cured cyanoacrylate adhesive.

Typical Applications

- Electronics wire tacking
- Bonding headsets
- Hose clips onto hoses
- Bonding automotive interior trim
- Tacking parts during assembly process
- Fabricate silicone and standard o-rings
- Disposable medical device bonding
- Bonding musical instruments
- Mobile phone casings, antennae
- Keypads for phones and tablets
- Sealing batteries
- Glazing applications
- Sealing transformer laminates

NEW HIGH TEMPERATURE RESISTANT CYANOACRYLATES!

High strength at high temperature!

PERMABOND® 825 is a low viscosity cyanoacrylate adhesive that provides higher strength at high temperature. This fast setting cyanoacrylate bonds metals, rubbers, plastics, and more. Permabond 825 resists up to 200°C (392°F) and has excellent retention of strength during thermal ageing. **Patented Technology**

Hot Strength

Features and Benefits

- Strong bonds that resist up to 200°C (392°F)
- Low viscosity 120 cPs
- Tolerates stresses at high temperature
- Does not require zero gap
- 2500 psi bonds to mild steel at 25°C (77°F)
- 600 psi bonds to mild steel at 150°C (300°F)
- Patented Technology

Permabond 825 Cyanoacrylate

Viscosity	100-150 cPs
Fixture Time Steel	10-20 sec
Shear Strength Steel (ISO4587)	2,175-2,900 psi 15-20 N/mm ²

Thermal Ageing at 180°C (356°F)

CYANOACRYLATES

* Note the 800 series does not require a secondary heat cure. Following is the secondary heat cure process for 919, 920, and 922: 1) Parts are bonded and clamped at room temperature for four hours. 2) The clamped parts are then heated at 150°C (302°F) for two hours. 3) After two hours, the bond will be thermally resistant up to 250°C (482°F).

Without the secondary heat cure activation of the high temperature resistance properties, these products will only resist temperatures up to 180°F (82°C)

Permabond general purpose ethyl cyanoacrylate adhesives quickly form bonds to a wide variety of substrates. Strengths listed here are for grit blasted steel, but these adhesives are known for their ability to very effectively bond plastics and other substrates.	General Purpose	101	Wicking type, plastic bonding
		102	Plastic bonding
		105	Elastomer bonding
		108	Intermediate gap fill, plastic bonding
		240	Plastic bonding, max. gap fill and flow control
		268	Fast curing maximum gap fill
		2010	Thixotropic, maximum gap fill
The original instant adhesive, 910, a pure methyl cyanoacrylate, creates very strong bonds between metal substrates.	Metals	170	Maximum gap fill
		910	The Original! General purpose
		910FS	Wicking type
Toughened cyanoacrylates are preferred when the assembly is subject to vibration, impact, peel, flexing stresses, or higher temperature.	Toughened	731	Excellent peel, impact, and shear strength
		735	Similar to 731, black
		737	Impact resistant, gap filling, black
		2050	Toughened
Surface insensitive cyanoacrylates overcome the challenges posed when bonding acidic surfaces such as wood, leather, paper, or cork. These ethyl cyanoacrylates also perform well on very dry or porous materials, extending the range of application possibilities.	Surface Insensitive	790	Very fast set, wicking type
		791	Very fast set, close fitting parts
		792	Very fast curing, higher temp. resist
		795	Fast curing, general purpose
		799	Fast curing, maximum gap fill
		2011	Non-sag, max. gap fill, high temp. resist
Permabond 800 series offers the highest temperature resistance available in ambient cure conditions. Permabond 919, 920, and 922 are formulated to offer increased temperature resistance with the use of the secondary heat cure process.	High Temperature Resistant*	801	Resists to 130°C, wicking type
		802	Resists to 160°C
		825	Resists to 200°C, Patented Technology
		919	Resists to 250°C after post cure, wicking type
		920	Resists to 250°C after post cure
		922	Resists to 250°C after post cure, max gap fill
Low odor formulations contain low vapor pressure monomers which result in a less volatile product. There is little to no odor during application and virtually no residue when cured.	Low Odor	940	Low odor and non-blooming, wicking type
		941	Low odor and non-blooming
		943	Low odor and non-blooming, general purpose
		947	Low odor and non-blooming, gap fill
USP Class VI and Cytotoxicity tested products for use in medical devices	Medical Device	4C10	Low viscosity
		4C20	Low - medium viscosity
		4C30	Medium - high viscosity
		4C40	High viscosity
3D Print infiltrants strengthen and seal 3D printed models produced via granular 3D printing methods.	3D Print Infiltrants	3D10	Ultra fast set time, high gloss surface
		3D30	Fast set time, shiny surface
		3D90	Delayed set, max strength, matte surface

EPOXY TWO COMPONENT

Key benefits of Permabond Two Part Epoxies include

- High peel strength for design versatility
- Easily dispensed with static mix nozzles
- Excellent chemical and environmental durability
- No curing equipment required

Epoxies - Two Component

MODIFIED EPOXY

Permabond Modified Epoxies are two component hybrid technology adhesives that cure at ambient temperature. Products are available in 10:1 and 2:1 dual cartridges for dispensing through static mix tips. These soft, flexible adhesives cure with very low shrinkage and are ideal for bonding thin materials with no read through, and for potting without disturbing sensitive electronic components. They form strong bonds to composites, metals, wood, FRP, glass, plastics, concrete, masonry, brick, and stone.

Tip: Permabond 2 component modified epoxies are available in dual cartridges with static mix nozzles. When using a mixing nozzle for the first time, dispense a bead of adhesive a couple of inches long onto a paper towel prior to dispensing onto your assembly. This will ensure the adhesive is completely mixed.

EPOXY ONE COMPONENT

Key benefits of Single Part Epoxies include

- High shear, impact, and peel strength increases joint design versatility
- Excellent chemical, temperature, and environmental resistance
- A good alternative to welding or brazing - reduces costs

Contact PermaBond for low temperature curing grades for bonding heat vulnerable parts.

MS POLYMERS

Permabond MS Polymers are single component, hybrid technology adhesives that moisture cure at ambient temperature. The high elongation and flexible nature of these strong bonds meet the demands of stress from impact, peel and expansion that can occur when bonding dissimilar materials. They have excellent environmental resistance and remain very flexible.

MS Polymers - Single Component			
Grade	MS359 Grey	MS359 A Grey	MS359 Clear

<i>Zinc</i>	2-3 N/mm ² (290 - 440 psi)	1-2 N/mm ² (145 - 290 psi)	2-3 N/mm ² (290 - 440 psi)
<i>PVC</i>	2-3 N/mm ² (290 - 440 psi)	1-2 N/mm ² (145 - 290 psi)	2-3 N/mm ² (290 - 440 psi)
<i>Polycarbonate</i>	1-1.5 N/mm ² (145 - 220 psi)	0.5-1 N/mm ² (75 - 145 psi)	1-1.5 N/mm ² (145 - 220 psi)
<i>Polystyrene</i>	1-1.5 N/mm ² (145 - 220 psi)	0.5-1.5 N/mm ² (75 - 220 psi)	1-1.5 N/mm ² (145 - 220 psi)
<i>Wood</i>	2-3 N/mm ² (290 - 440 psi)	1-2 N/mm ² (145 - 290 psi)	2-3 N/mm ² (290 - 440 psi)

Benefits of MS Polymers

- Adhesion to a variety of substrates
- Fast tack free time
- Non-corrosive
- Paintable

POLYURETHANES

Key benefits of Permabond Polyurethanes include

- Good tensile strength
- No primer needed
- Ease of application
- Various set times to match production needs
- Adhesion to a variety of substrates

Permabond Polyurethanes are ideal for many bonding applications including bonding composites, plastics, leather, and other materials in automotive applications.

Products are available with long working life to allow use on large bonding and potting areas. In addition to composites, leather, and plastics, Permabond Two Component Polyurethanes form strong bonds to metals, wood, and glass.

Polyurethanes have good resistance to both polar and non polar solvents. They form resilient bonds with higher adhesive tensile strength than MS polymers or modified epoxies.

Polyurethane - Two Component			
Grade	PT321	PT326	PT328
Description	Fast, Strong	Moderate Pot Life	Extended Pot Life
Color Part A	Black	Black	Black

Pot Life	1 - 1.5 min	4 - 7 min	15 - 20 min
Handling Strength	10 - 15 min	60 - 90 min	90 - 120 min
Full Strength cured @ 23°C	24 hours	4-5 days	4-5 days
Full Strength cured @ 90°C	30 min	30 min	30 min
Hardness	D 70 - 80	D 65 - 75	D 60 - 75
Elongation	<10%	<15%	<20%
Shear Strength Grit Blasted Steel	2,600-3,600 psi (18 - 25 N/mm ²)	1,700-2,900 psi (12 - 20 N/mm ²)	1,700-2,600 psi (12 - 18 N/mm ²)
Tensile Strength	2,900-3,600 psi (20 - 25 N/mm ²)	2,300-3,600 psi (16 - 25 N/mm ²)	2,200-2,900 psi (15 - 20 N/mm ²)
Temperature Range	-40 to 248 °F (-40 to +120 °C)	-40 to 248 °F (-40 to +120 °C)	-40 to 248 °F (-40 to +120 °C)

Tip: Permabond two component polyurethanes are available in dual cartridges with static mix nozzles. When using a mixing nozzle for the first time, dispense a bead of adhesive a couple of inches long onto a paper towel prior to dispensing onto your assembly. This will ensure the adhesive is completely mixed.

UV LIGHT CURABLES

Permabond UV Light Curable Adhesives are single part, cure on demand, solvent-free adhesives. With temperature ranges of -65 to 250°F (-54 to 120°C), they are suitable for a wide range of applications. UV curable adhesives cure when UV light activates the photo initiators. Many products also have visible light cure capabilities. Except for dual cure formulas, the curing process will cease when the light is removed.

Permabond UV7141 has a secondary anaerobic cure mechanism. UV light can be used to cure the exposed area and the adhesive between the two pieces of metal will continue curing anaerobically. This product also has a slightly higher temperature resistance -65°F to 300°F (-54°C to 150°C).

Key benefits of UV Curable Adhesives include

- High strength bonds
- Cure only when exposed to light – permits alignment of parts prior to bonding
- Select a cure speed – double production speed by simply adding another lamp to the line
- Solvent-free – Non-flammable, increased safety
- Single part product – No mixing required
- 100% solids – No waste
- Save energy – UV lamps require less electricity than heat cure ovens for epoxies
- Space savings – UV lamps require less space than heat cure oven tunnels
- Appearance – UV adhesives are available in clear colorless formulations

Cure speed is affected by the wavelength and intensity of light at the bond site. Distance, attenuation, and light absorption by the substrate and through the gap of the adhesive all play a role in cure rate. Permabond adhesives have been designed to cure quickly with low intensity lamps.

Applications include

- Glass furniture
- Glass to metal structural bonding
- Lenses
- Solar panels
- Acrylic display racks
- Electronics
- Glass ornaments
- Trophies

STRUCTURAL ACRYLICS

Permabond's line of structural acrylics was developed for demanding applications that require high tensile, shear, and peel strength as well as maximum shock and impact resistance.

They offer fast fixture and cure at room temperature providing a solution to the continuous demands for increased line speeds while decreasing the manufacturing costs that are associated with heat curing.

Permabond structural acrylics are suitable for bonding a wide variety of substrates, offering great material selection. Materials such as metals, glass, and composites are easily bonded with Permabond structural acrylics.

Structural Acrylic adhesive types:

- Two component
- No-mix surface activated
- Two component for difficult to bond plastics

PermaBond no-mix, surface activated structural acrylics are solvent free and greatly increase design possibilities. They form strong bonds to a wide variety of substrates including metals, glass, magnets, and composites. They are ideal for applications involving close fitting parts.

Untreated polypropylene lap shears bonded with TA4610.

The adhesive bond is so strong the plastic stretches, deforms, and fails before the bonded joint.

NEW STRUCTURAL ACRYLICS FOR DIFFICULT TO BOND PLASTICS

Permabond TA4660 is a patent pending structural acrylic adhesive that produces high-strength bonds on filled and unfilled nylon 6 and 6,6 with no pretreatment required. In pull tests, nylon bonded with TA4660 fails before the adhesive! Bonds have good strength retention at high temperature and absorb differential thermal expansion and contraction stress without causing the bond to fracture.

TA4660 Structural Adhesive

New Breakthrough Technology for Nylon Bonding

The image to the right shows the adhesive bond is so strong that the nylon deforms and breaks.

Structural Acrylic Nylon Bonder TA4660	
Description	Two-part 2:1 mix ratio structural adhesive designed for use on filled & unfilled nylon surfaces
Appearance	A side: Yellow / B side: Black / Mixed: Green-black
Gap fill (max)	1 mm (0.04 in)
Features	Excellent adhesion to nylon / Full cure at room temperature / Microbeads for a controlled bond line / No primer required / Low odor / Good temperature resistance
Curing Time	Pot Life 5 mins / Fixture Time 25 mins / Handling Time 90 mins / Working Strength 2 hrs / Full Strength 48 hrs
Shear strength	PA6: >10 N/mm ² (>1450 psi) Substrate Failure PA6,6: >6 N/mm ² (>870 psi) Substrate Failure PA6 30% GF: 14-18 N/mm ² (2030-2610 psi) Mild Steel to PA6,6: >10 N/mm ² (>1450 psi) Substrate Failure Aluminium to PA6,6: >10 N/mm ² (1450 psi) Substrate Failure
Tensile strength	20 N/mm ² (2900 psi)
Elongation	11%
Service Temperature	-40 to +120°C (-40 to + 250°F)
Packaging	10 x 50ml pack of cartridges / 6 x 400ml pack of cartridges
